PRIMUS Series on History of Science

in collaboration with

Society for the History of Science, Kolkata

About the Series:

This ~~book~~ series brings together scholars from different disciplines to showcase ~~the~~ recent trends in the history of science in India. Here, the term "science" also includes technology, the environment, and medicine. The term "history" encompasses all possible dimensions of history, i.e., multiple histories. Scholars are increasingly focusing on non-Western scientific traditions and knowledge systems by challenging the notion that "modern science" is solely Western. The ~~trend~~ also emphasizes science as a global enterprise, shaped by politics, empire, and mobility. This series interrogates conventional narratives regarding scientific advancement and underscores the significance of embracing diverse historical perspectives by acknowledging and valuing local knowledge practices. It identifies transnational networks and the circulation of ideas, instruments, and texts across regions, and examines how colonial, trade, and diplomatic routes shaped scientific exchange.

The series also connects scientific knowledge to bureaucracy, capitalism, and government policy by exploring institutional histories, funding, ~~and~~ political power structures and ethical and societal implications of "big science and technology." It acknowledges that connecting scholarly history with public awareness and understanding is ~~significant. The series~~ aims to showcase the relationship between public memory and scientific heritage while also examining the role of science communication in popular media. Thus, the ~~key objective of the~~ series ~~is to welcome~~ monographs and edited collections addressing these areas. The series will appeal to scholars and students across various disciplines, including history, sociology, economics, politics, anthropology, and Science, Technology, and Society (STS). This also encompasses fields such as basic sciences, medicine, and engineering.
